Amendments to the Claims:

This listing of claims will replace all prior versions, and listings of claims in the application:

Listing of Claims:

1.   (Currently amended) A method for clustering a plurality of items, each of the items including information, guided toward an initial organization structure, the method comprising:

inputting a plurality of items, each of the items including information, into a clustering process;

inputting an initial organization structure into the clustering process, the initial organization structure including one or more categories, at least one of the categories being associated with one of the items;

processing using at least processing hardware the plurality of items based upon at least the initial organization structure and the information in each of the items in at least the clustering process;

automatically determining using at least the processing hardware a resulting organization structure based upon the processing of the plurality of items, the initial organization structure, and the information in each of the items, the resulting organization structure comprising at least a portion of the initial organization structure and at least one additional category coupled to the initial organization structure; and

storing the resulting organization structure in memory.

2.   (Original) The method of claim 1 wherein the processing comprises determining a likeness level between a first item and a second item, the likeness level between two items increased if they are both similar to items in one or more of the categories of the initial organization structure.

3.   (Currently amended) The method of claim 2 wherein the determining the likeness level between the first item and the second item comprising comprises:

associating a first feature vector with the first item and a second feature vector with the second item, each feature vector representing information associated with each item;

adding a first additional feature and a second additional feature to the first feature vector and the second feature vector of the first item and the second item, respectively, the first additional feature representing a first category of the initial organization structure and the second additional feature representing a second category of the initial organization structure, the first additional feature providing a degree to which the first item is similar to one or more items in the first category of the initial organization structure; and

calculating a degree of similarity of the first item and the second item including calculating a similarity measure between the first additional feature and the second additional feature.

4.   (Canceled)

5.   (Original) The method of claim 1 wherein the resulting organization structure relates to the initial organization structure based upon a category similarity.

6.   (Original) The method of claim 1 wherein the resulting organization structure relates to the initial organization structure based upon a similarity of hierarchy structure.

7.   (Original) The method of claim 1 wherein the item is a document, a product, a person, a DNA sequence, a purchase transaction, a financial record, or a species description.

8.   (Original) The method of claims 1 further comprising outputting the resulting organization structure on an output device.

9.   (Original) The method of claim 1 wherein the processing hardware uses at least a 500 MHz clock to efficiently run the clustering process.

10.   (Original) The method of claim 1 wherein the plurality of items includes at least 10,000 items.

11.   (Currently amended) A computer aided information organization device, the device including one or more computer memories, the one or more computer memories including:

a first code directed to inputting at least 10,000 items in electronic form into a clustering process, each of the items including information;

a second code directed to inputting an initial organization structure in electronic form into the clustering process, the initial organization structure including one or more categories, at least one of the categories being associated with one of the items;

a third code directed to processing using at least processing hardware the plurality of items based upon at least the initial organization structure and the information in each of the items in at least the clustering process;

a fourth code directed to <u>automatically</u> determining a resulting organization structure based upon the processing, the resulting organization structure comprising at least a portion of the initial organization structure and at least one additional category coupled to the initial organization structure; and

a fifth code directed to storing the resulting organization structure in the one or more memories or another memory.

12.   (Original) The device of claim 11 further comprising a sixth code directed to determining a likeness level between a first item and a second item, the likeness level between the first item and the second item increases if they are both similar to items in one or more of the categories in the initial organization structure.

13.   (Original) The device of claims 12 wherein the sixth code directed to determining the likeness level between the first item and the second item comprising:

a code directed to associating a first feature vector with the first item and a second feature vector with the second item, each feature vector relating to information associated with the item;

a code directed to extending the feature vector of each item with an additional feature representing a category of the initial organization structure, the additional feature relating to a degree to which the item is similar to one or more items in the corresponding category of the initial organization structure; and

a code directed to calculating a measure of similarity of the first item with the second item including calculating the similarity measure between the first additional feature and the second additional feature.

14.   (Canceled)

15.   (Original) The device of claim 11 further comprising a sixth code directed to outputting the resulting organization structure, the resulting organization structure including a plurality of categories.

16.   (Original) The device of claim 15 further comprising a seventh code directed to inputting additional items using the resulting organization structure.

17.   (Original) The device of claim 11 further comprising a sixth code directed to independently modifying the resulting organization structure using a graphical user interface.

18.   (Original) The device of claim 17 wherein the independently modifying is provided by a user coupled to the graphical user interface.

19.   (Currently amended) A computer implemented method for clustering a plurality of items, the method comprising:

inputting a first hierarchy, the first hierarchy ~~includes~~ including at least one category;

inputting a plurality of items, each of the plurality of items ~~includes~~ including

information;

the at least one category being associated with one of the items;

processing by the computer the plurality of items based upon at least the first

hierarchy and the information in each of the items;

automatically determining by the computer a second hierarchy based upon the

processing of the plurality of items, the first hierarchy, and the information in each of the items,

the second hierarchy ~~includes~~ including a portion of the first hierarchy and at least one additional

category coupled to the first hierarchy;

storing the second hierarchy in ~~memory, and~~ memory; and

assigning each of the plurality of items to a category of the second hierarchy.
